

### Section 8.3- Error and Power

- When we reject our null hypothesis, are we definitely right? Is the null absolutely positively wrong?

NO!

- When we fail to reject our null hypothesis, is it absolutely true?

NO!

Ex: innocent vs. not guilty

$H_0$ :

$H_a$ :

Types of Error:

Decision

truth  $H_0$

	Ho True	Ho False
Reject Ho	Type I Error $\alpha$	Correct power
Fail to Reject Ho	Correct.	Type II Error $\beta$

Type I Error =

- reject  $H_0$  when  $H_0$  true

\* more serious \*

Ex: religion, business

•  $P(\text{Type I Error}) =$

$\alpha$   
↑  
sign. level

Type II Error =

(accept)  
- fail to reject  $H_0$  when  
 $H_0$  false

\* less serious \*

•  $P(\text{Type II Error}) =$

$\beta$

POWER - ~~good~~

Power = reject  $H_0$  when  $H_0$  false.  
another prop. is true

- Formula:  $\text{Power} = 1 - \beta$   
 $\beta = 1 - \text{power}$

$$H_0: p = 0.30$$

$$H_a: p \geq 0.30$$

$$p = 0.70$$

$$p = 0.05$$

## Calculating Power

1. STATE: important info

- $H_0, H_a$

- $n$

- $\alpha$

- $P_A$  = alternative prop. that's true

prob. of  
rejecting  $H_0$   
when  $P_A$  is true

$H_0: p = 0.30$

$H_a: p > 0.30$

$\hat{p} = 0.70$

$\hat{p} = 0.60$

$\hat{p} = 0.35$

$\hat{p} = 0.32$

$\hat{p} = 0.05$

2. FIND:

- rejection region =

values of  $\hat{p}$  that will reject  $H_0$   
\* bypass  $z$  &  $p$ -val.

3. CALCULATE:

4. Power is considered adequate when:

5. This is only done on...

Example: We want to examine the color distribution in a bag of Skittles. We believe that the machine that fills these bags is not putting the right amount of colors in each because we have gotten 3 bags recently that have a lot of red in them. There are claimed to be 30% reds in each bag. To check whether the colors are correct, employees select a random sample of 35 packages. Is this test sufficiently sensitive to detect an increase of 0.05 in the proportion of red Skittles? Calculate the power of this test against the alternative.

State the hypotheses, the alternative that we want to detect and the significance level.

Find the values of  $p$  that will lead to the rejection of  $H_0$ . (rejection region)

Calculate the probability of observing these values of  $p$  when the alternative is true.

Find the probability of Type I and Type II errors.

Example: (2 sided test with power)

$H_0: p = 0.75$                        $\alpha = 0.01$

$H_a: p = 0.75$                        $n = 60$

What is the power of the test against the alternative of  $p = 0.80$ ?

State the hypotheses, the alternative that we want to detect and the significance level.

Find the values of  $p$  that will lead to the rejection of  $H_0$ . (rejection region)

Calculate the probability of observing these values of  $p$  when the alternative is true.

Find the probability of Type I and Type II errors.

## Increasing Power

3 things we can do to increase power are....

1. Increase
2. Increase
3. Consider
